PROFILE

- Computer Engineering student targeting Software/AI Engineering or DevOps internships; 5+ years' experience in FQA industry.
- Good programming foundation (Python, C/C++, Java, JavaScript) with hands-on experience building school projects.
- AI + DevOps focus: built small LLM API integrations and an introductory RAG prototype; comfortable with Linux and Git workflows.

EDUCATION

BEng in Computer Engineering
Concordia University, Montreal, QC

2022 - 2027

TECHNICAL SKILLS

Programming Languages: Java, Python, C++, JavaScript

Operating Systems: Windows, macOS, Linux

Tools & Platforms: Git/GitHub, GitHub Actions, Jira, TestRail, Postman, Selenium, Node.js, Claude Code

AI / LLM: LLM APIs (integration), prompt iteration, embeddings, vector search (basics), Retrieval-Augmented Generation (RAG) prototype

LANGUAGE SKILLS

Languages: Fluent English, Basic French, Fluent Chinese

CAREER

QA Tester
GlobalStep, Montreal, QC

Feb 2020 - Present

- Tested live-service mobile/console game features for Disney's "*Disney Mirrorverse*" and Marvel titles (*Realm of Champions*, *Contest of Champions*).

- Created and executed test plans/cases; performed functional, regression, and exploratory testing for new releases.
- Logged and tracked defects end-to-end using Jira/TestRail; collaborated with developers for reproduction and triage.
- Maintained strong client communication on quality and release readiness.

PROJECTS

SMS Spam Classifier (COMP 472)

May 2026

- Built a spam/ham SMS classifier using TF-IDF vectorization and Logistic Regression with balanced class weights.
- Applied stratified train/test splitting to preserve class distribution and evaluated performance with confusion matrices and per-class precision/recall analysis.
- Visualized prediction confidence and misclassification patterns with matplotlib to identify failure cases and guide model tuning.

Student Support Chatbot with RAG Extension

Apr 2026

- Developed a semantic-search chatbot for student support queries using SentenceTransformer embeddings (all-MiniLM-L6-v2) and cosine similarity retrieval over a curated Q&A knowledge base.
- Integrated RoBERTa-based sentiment analysis to detect frustrated or distressed users and trigger escalation to human support.
- Extended the system into a RAG prototype by connecting retrieval results to the OpenAI API for grounded, generated responses instead of fixed answers.

TCP/UDP News Sharing System

Feb 2026

- Developed a client-server news sharing system supporting both TCP and UDP communication, with modular message routing and request/response handling.
- Implemented parsing/serialization plus basic UDP reliability (timeouts, retries) to handle packet loss and out-of-order delivery.
- Validated robustness by testing under simulated latency/packet loss and verifying correct delivery behavior and timeout handling.

Breathalyzer Android App

June 2025

- Built an Android app that estimates and displays BAC from user inputs and drink profiles using configurable parameters and safe-input validation.
- Implemented unit conversions, persistent settings, and error handling; improved UX with clear feedback for invalid or out-of-range inputs.
- Performed regression and edge-case testing across devices/emulators to verify calculation correctness, formatting, and settings persistence.

Web Communication Platform

Feb 2025

- Developed a web communication platform with user authentication and real-time messaging; designed REST APIs and backend services in Node.js.
- Implemented core features end-to-end (auth flows, messaging, API error handling) and validated endpoints with Postman-based smoke checks.
- Applied QA mindset: documented smoke/regression scenarios and tracked issues with Jira/TestRail-style workflows to improve stability and release readiness.
